

# HVDC as Enabling Technology for Electricity Markets

**Jingxuan (Joanne) Hu**  
**CIGRE Study Committee B4 – HVDC and Power Electronics**  
**RBJ Engineering, Vice President**

**Opening Panel, Paris 22<sup>nd</sup> August 2016**

# HVDC Overview

## Role of HVDC

- Long distance transmission and asynchronous system interconnections
- Enhanced power system operation with interconnections and integration of renewable generation

## Two Parallel Technology Paths

- Mature and Growing Thyristor based LCC HVDC
- Developing and Growing IGBT and IEGT based VSC HVDC

# HVDC Enable Integration of Electric Power Market

Global environmental concerns require more efficient and cleaner power generation and transmission

Growing  
Exploitation  
of  
Renewable  
energy  
resources

Large-scale  
energy trading &  
a growing share  
of fluctuating  
renewable  
energy

Renewable  
resources are  
frequently located  
far away from load  
centers and existing  
transmission system

HVDC  
Technology  
is suited to  
integrate  
Renewable  
Energy  
Resources  
into Power  
Systems

# HVDC - Suitable to Integrate Renewable Energy

---

Lower line/cable investment cost

---

Lower losses

---

Asynchronous interconnections

---

Better Controllability

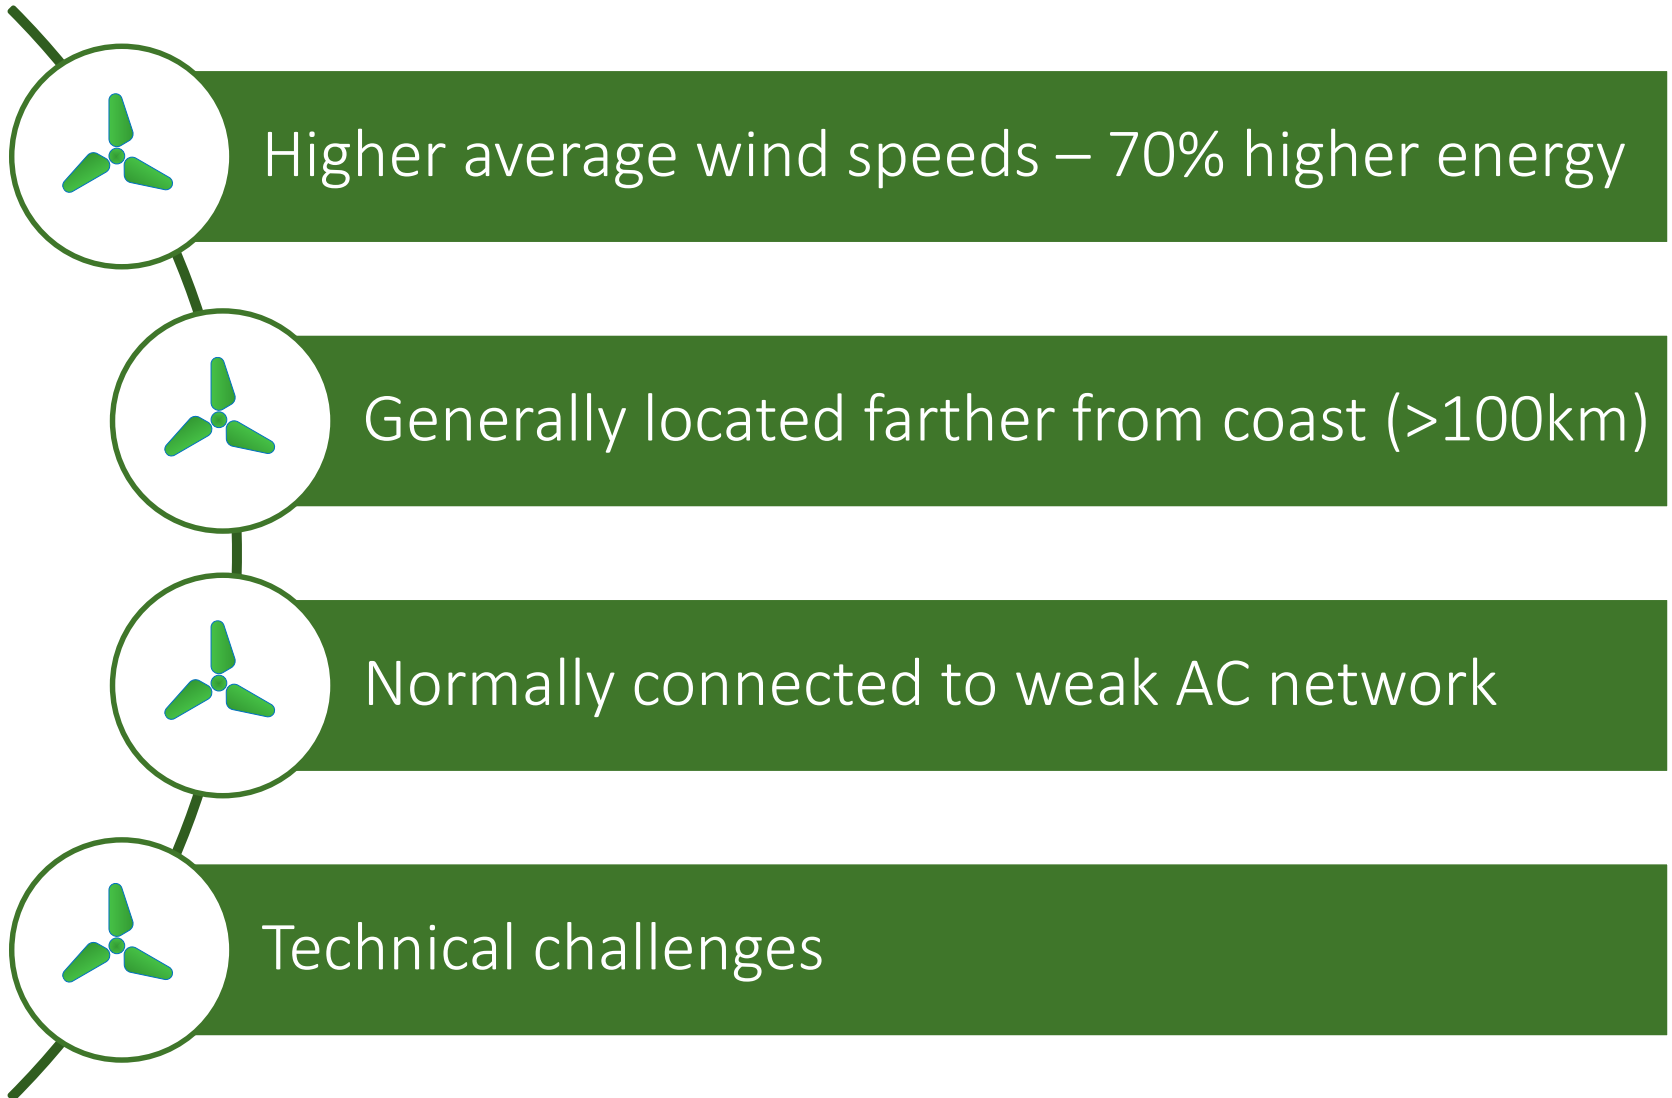

---

Limited short circuit current contribution

---

Environment benefits such as power balancing, reduced right-of-way for same amount of power transfer

# Growing Offshore Wind Power

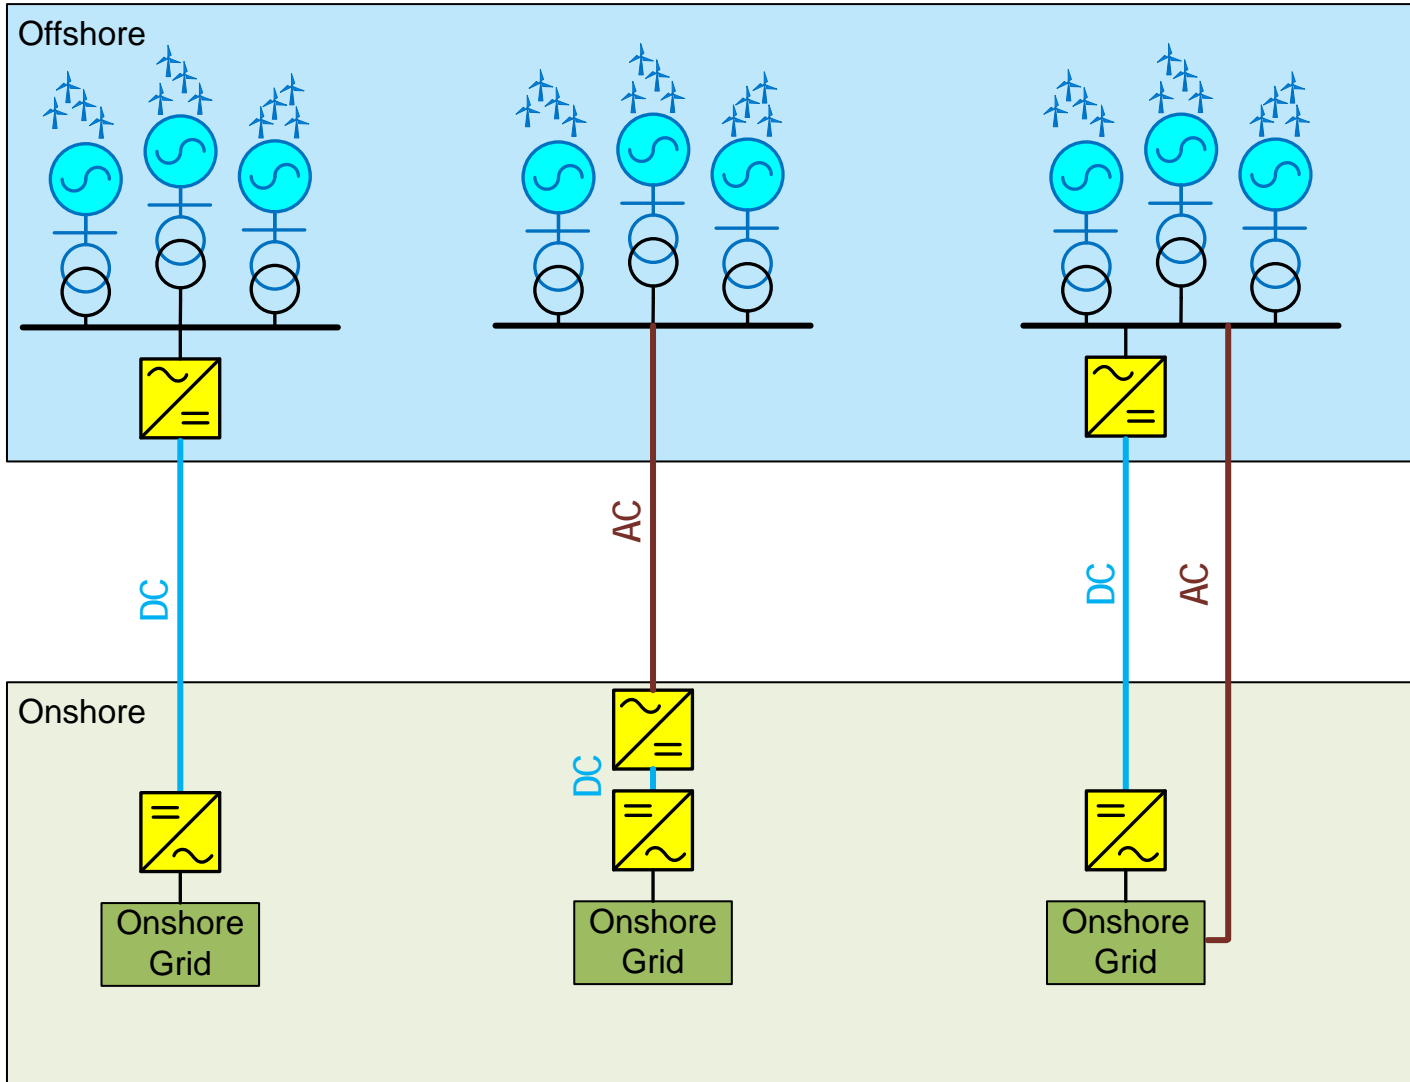

# VSC-HVDC for Offshore Windfarm Connection

- ✦ Ability to transfer power in both directions
- ✦ Easy Integration with Wind Turbine Generators in islanded grids with very low short circuit strength
- ✦ Normally, no need for harmonic filters and additional reactive power resources
- ✦ Improved performance during onshore disturbance
- ✦ Black-start capability
- ✦ Allow building compact, partially or fully tested and assembled, converter station on shore
- ✦ Ability to utilize XLPE cables
- ✦ Expansion to future multi-terminal grids

# Connection Schemes

DC Point-to-Point Direct Connection

AC Point-to-Point DC Back-to-Back Connection

DC/AC Parallel Hybrid Connection

# Existing/Planned Offshore Wind Connected by VSC HVDC (North Sea)

- planned
- under construction
- in operation
- offshore network connections in operation
- offshore network connections in tender/under construction
- transmission network
- offshore platform
- converterstation onshore
- substation platform, wind farm
- substation onshore

**800 megawatts output**  
Power for **1 million households**  
Started: **1<sup>st</sup> half of 2015**

**BorWin 2**

In commercial operation

**864 megawatts output**  
Power for **1.1 million households**  
Start: **1<sup>st</sup> half of 2015**

**SylWin 1**

In commercial operation

**576 megawatts output**  
Power for **700,000 households**  
Started: **1<sup>st</sup> half of 2015**

**HelWin 1**

In commercial operation

**690 megawatts output**  
Power for **900,000 households**  
Start: **1<sup>st</sup> half of 2015**

**HelWin 2**

In commercial operation

**900 megawatts output**  
Power for **1.1 million households**  
Start: **2019**

**BorWin 3**

On schedule, within budget

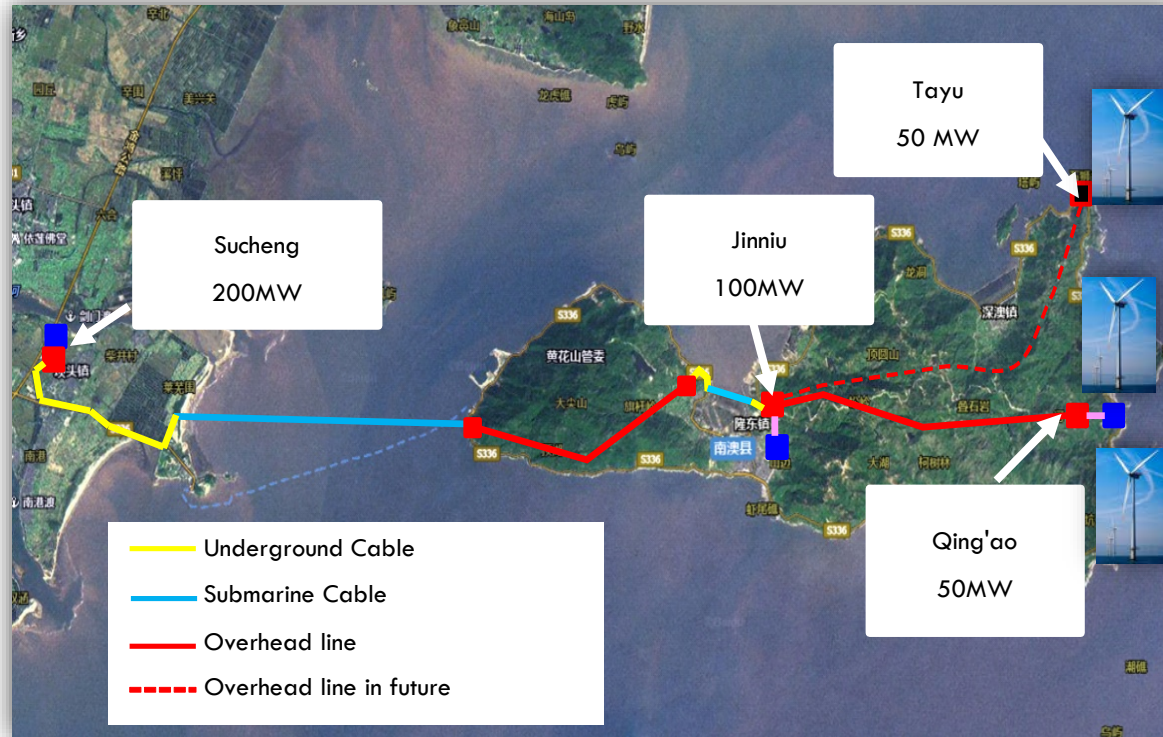

# Existing/Planned Offshore Wind Connected by VSC-HVDC (North Sea)

| Application | Rating (MW) | DC Voltage (kV) | AC Voltage (kV) |         | HVDC Cable (km) |            | In Service Year |
|-------------|-------------|-----------------|-----------------|---------|-----------------|------------|-----------------|
|             |             |                 | Offshore        | Onshore | Submarine       | Ungrounded |                 |

# VSC Project - Renewable Energy Integration

## Nan'ao ±160 kV VSC-MTDC Project

Stabilizing 200MW wind power output on the island and eliminating wind curtailment

200MW

Up to May, 2016, 463 million kwh wind power in total is transported to the main land

463 million kwh

### Features

- The first multi-terminal VSC-HVDC project
- Wind Energy of Nan'ao island is transported to mainland power grid by AC and DC lines in parallel
- Commissioned in 2013

### Major Parameters

±160 kV, 200/100/50/50MW

Overhead Line (20.6km in total),  
Underground Cable (9.5 km),  
Submarine Cable 10.7 km

# Bulk Onshore WPPs Integration using LCC-HVDC

High reliability and availability

Low losses

High power ratings

Rapid clearing of DC line fault currents

Large onshore wind power plants are connected to the AC system

- to deliver wind power into the local AC systems
- to supply auxiliary power for the wind power plant/ collector system in times of no wind

No stringent requirement for black-start capability

# Multi-terminal LCC Project – North – East Agra UHVDC Link

## Connecting power from the Northeast region with the rest of India

World's first multi-terminal ultra-high-voltage direct current link

Once commissioned, the North-East Agra power connection will transmit power over long distances through the very narrow Siliguri Corridor connecting the northeast of India with the rest of the country.

The link is **1,728 km long**

which is approximately the distance from Kolkata to Bangkok

The link will have the capability – at full converter capacity – to transmit

**8,000 MW** of electricity

equivalent to the generation of 8 large power plants

... enough to meet the needs of **90 million Indian citizens**

That is more than the population of Germany.

# LCC-VSC Project - Regional AC-Grid Support

Luxi Parallel VSC & LCC BTB HVDC Project

## Features

- **Asynchronous interconnection between Yunnan and the Main grid for grid support in emergency**
- **Highest voltage level and power rating for BTB VSC-HVDC project in the world**
- **Parallel LCC & VSC BTB converters at the same station**
- **Plan to commission in 2016**

## Major Parameters

- **VSC:  $\pm 350$  kV      1000 MW**
- **LCC:  $\pm 160$  kV     $2 \times 1000$  MW**

# HVDC Outlook

LCC continues as the workhorse for high power point to point interconnections with inherent advantages of

*Higher power ratings for the moment*

*Generally better short term overload capability*

*Fast fault clearing and power restoration on overhead lines*

VSC technology is closing the gap

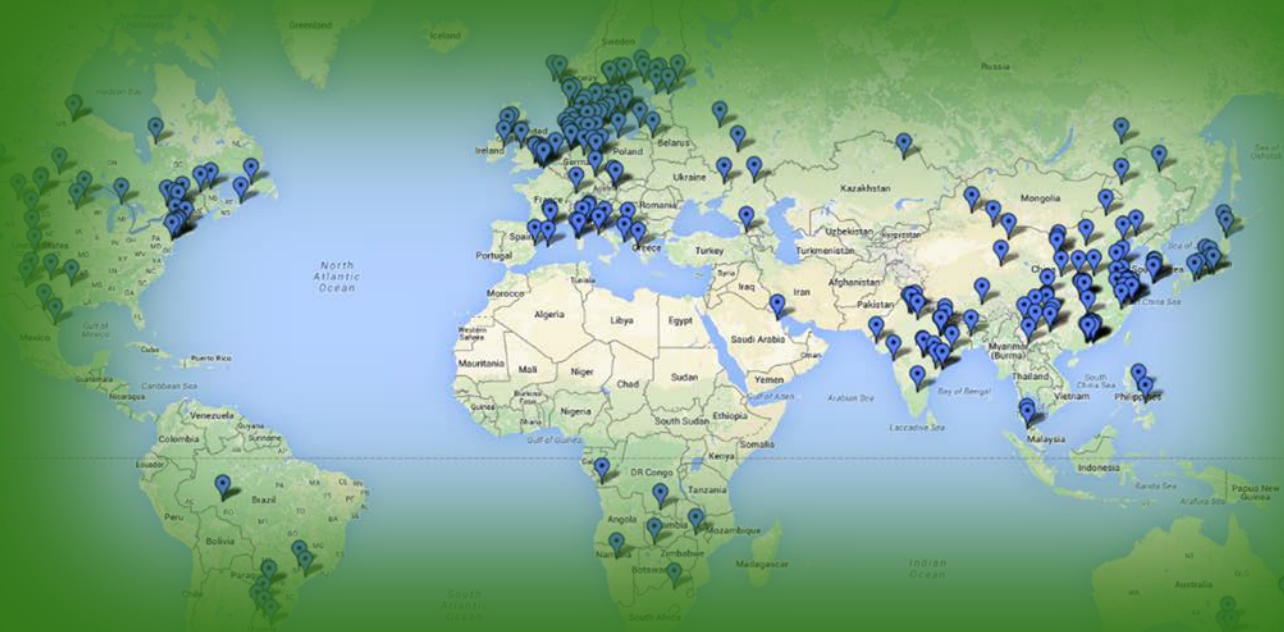

*Power transfer capability is rapidly increasing*

*Inherent advantages include reduced footprint, reduced filtering and capability to directly support ac system voltage*

*Particularly suited for cable applications since voltage reversal is not needed for power reversal*

*Developments in HVDC breakers, full bridge converters and cable voltage rating are allowing application at high power with overhead line applications as well as cable*

Both technologies are suitable for integration of renewable generation

# HVDC Powers Up the World!
